Anorexia nervosa is an eating disorder that makes people lose more weight than is considered healthy for their age and height. Persons with this disorder may suffer from an eating disorder called anorexia nervosa. The disorder, which usually begins in young people around 15 years old, is characterized by an unrealistic fear of weight gain, a distorted view of their body, and a distorted body image. Anorexia nervosa is a complex eating disorder with three key features: refusal to maintain a healthy body weight; an intense fear of gaining weight; and a distorted view of their body. Anorexia nervosa is characterized by low body weight. Anorexia nervosa is a serious and potentially life-threatening mental illness, not a lifestyle choice. A person with Anorexia nervosa deliberately loses weight and often finds that food dominates their life. The weight loss is not easy to maintain. Anorexia nervosa is a serious, potentially life-threatening eating disorder characterized by self-starvation and excessive weight loss. Anorexia nervosa is a psychiatric disorder characterized by an unrealistic fear of weight gain, self-starvation, and conspicuous appetite-s Suppressing. Anorexia nervosa is a serious, potentially life-threatening eating disorder characterized by self-starvation and excessive weight loss. Symptoms of anorexia nervosa include being very underweight, under-eating, and laxative, diuretic, and appetite-suppressant use. Anorexia nervosa is a serious, potentially life-threatening eating disorder characterized by self-starvation and excessive weight loss. Anorexia nervosa is characterized by an abnormally low body weight, intense fear of gaining weight, and a distortion of body image. Anorexia nervosa is a psychiatric disorder characterized by an unrealistic fear of weight gain, self-starvation, and conspicuous appetite-suppressant use.
