British University Observatories, 1772-1939

Roger Hutchins

The book covers the six British university observatories that undertook systematic research between 1772 and 1939. It is the tap-root of the discipline from which the community of professional astronomers emerged. It is the great strength of this volume by Roger Hutchins that six British university observatories—ranging north to south from Glasgow, Durham, and Dunsink to Oxford, Cambridge, Durham, Dublin, Glasgow and London, undertook systematic research between 1772 and 1939.
