Managing locally important policies is shifting from federal to state and local governments. As this happens, there is a growing need for policies and procedures that allow citizens to assess the benefits of their local communities. Improving Information for Policy Analysis, Modeling, and Simulation is an important part of this process. The Policy Analysis Modeling System, developed by the Community Policy Analysis System (CPAS) at the University of Kentucky, allows policymakers to evaluate the impacts of policies on local economies and communities.

The CPAS system is designed to support the design of efficient and effective models for supporting decision-making. Estimating Labor and Fiscal Impacts using Louisiana Community Economic Impact Policy Analysis Modeling is one example of how the CPAS system is used to help policymakers understand the impacts of policies on local economies and communities.

The CPAS system is also used to support the design of efficient models for supporting decision-making. Estimating Labor and Fiscal Impacts using Louisiana Community Economic Impact Policy Analysis Modeling is one example of how the CPAS system is used to help policymakers understand the impacts of policies on local economies and communities.
