Researchers from North Carolina State University and the University of Eastern Finland have developed new "sensing skin" technology for the application of neural network in predicting damage of concrete structures. Due to its low thermal conductivity, a layer of concrete is frequently used for fireproofing of steel structures. However, application of Fuzzy Pattern Recognition of Seismic Damage to Concrete Structures. The sensitivity of the EM admittance and the structural mechanical impedance to the damages above the microstructure of concrete is first presented: they lead us to conclude that damage by microcracking is the main phenomenon in the concrete.
