Advances Against Chronic Pain - US News The last postgraduate issue of the BJA dedicated to clinical and basic science advances in pain medicine was in 2008, and was based on a meeting to celebrate. Recent advances in the pharmacological management of acute and chronic pain were presented in the proceedings of the 2008 Pain Management Conference. Nonopioid pain management and the use of novel pharmacological agents were emphasized.

Recent advances in nonopioid pain management have been highlighted in recent issues of the BJA. Nonopioid analgesics, such asacetaminophen and nonsteroidal anti-inflammatory drugs, have been shown to be effective in the treatment of mild to moderate pain. Additionally, the use of adjuvant medications, such astopiramate and Gabapentin, has been shown to be effective in the treatment of neuropathic pain.

New Advances in Pain Management and Cancer - In recent years, advances in the management of pain associated with cancer have been made. Nonopioid analgesics, such asparacetamol and ibuprofen, have been shown to be effective in the treatment of mild to moderate pain. Additionally, the use of adjuvant medications, such as tramadol and duloxetine, has been shown to be effective in the treatment of neuropathic pain.

Noninvasive brain stimulation techniques, such as transcranial magnetic stimulation and deep brain stimulation, have been shown to be effective in the treatment of chronic pain. These techniques are increasingly being used in clinical practice and are expected to continue to be refined in the future.
